

About SKF VSM

Drawing on its experience as an OE supplier to car manufacturers around the globe, SKF Vehicle Service Market deals with the aftermarket for cars and commercial vehicles all over the world. Their concept is to offer high quality products and premium services to their customers, whether your profession involves maintaining vehicles or supplying products to those who do.

Objective

To develop a program that decreases the manual work in setting product prices for the european contries.

Solution

The final product is a program, Frigg, which is based on C# and MS SQL / Oracle as the database.

FRIGG – Price Engine

Project
Among other things VSM creates price lists for each country in the organization. VSM wanted a program to decrease the manual work.

Vision
 This project was to make generation of prices more efficient and quality assured.

The work
 The work included to document the business rules as well as develop the solution and do the programming. The program needs a lot of external and internal information so a lot of connections to different systems was done. Even cryptic communication to external databases. The program handles a lot of secret information and the programming has to be according to that. All countries has to make their own price lists based on local information but also based on internal SKF algorithms to make attractive prices and make a good profit for SKF.

Result
 FRIGG is still an ongoing project
